Gain up to 4 times more signal at depth
Improve z-resolution and decrease optical aberrations for more accurate reconstruction of 3D samples.

Gain sharper, crisper images
Better light collection results in images with brighter intensity at lower exposure times, contributing to better quality of data.

Benefits
- Increase in penetration depths dependent on sample
- Improve z-resolution and decrease optical aberrations
- Gain sharper, crisper images
- Acquire 3D samples at high throughput
- Shorten image acquisition time
Streamline set up to get started more quickly
Water immersion objectives are field upgradeable and can be implemented with minimal change to current workflows.

Run your samples with confidence
MetaXpress software includes integrated, user-intuitive sensors and alerts to indicate the system health of the water controller system to give you peace of mind when running your samples.

Acquire 3D samples at high throughput
The ImageXpress Micro Confocal system with water immersion objectives automatically replenishes the water during acquisition, so the entire microplate sample can be acquired at high throughput.

Simplify viewing and quantitation of 3D structures
Analyze spheroids, microtissues, cells in a 3D matrix, and small organisms that are acquired as a stack of z-planes. Utilize the MetaXpress 3D Analysis Module to evaluate volume, XYZ location, distance to neighboring objects, diameter, depth, various intensity measurements, texture, or number of objects.

Shorten image acquisition time
QuickID targeted acquisition images at low magnification to find objects of interest or rare events, then, automatically acquires high-magnification images with the required wavelengths, z-stack, or time points. This analysis process shortens acquisition time and reduces imaging storage requirements by acquiring selected targets at high magnification.
