# *Using BLI (Octet) to Determine [IgG]*

- Principles of operation
- Qualification of the method
- Anti-IgG tips vs. Protein A tips
- Comparison with other methods
- Applications at Raven

# *Bio-Layer Interferometry (BLI)*

A layer of molecules attached to the tip of an optical fiber creates an interference pattern at the detector.

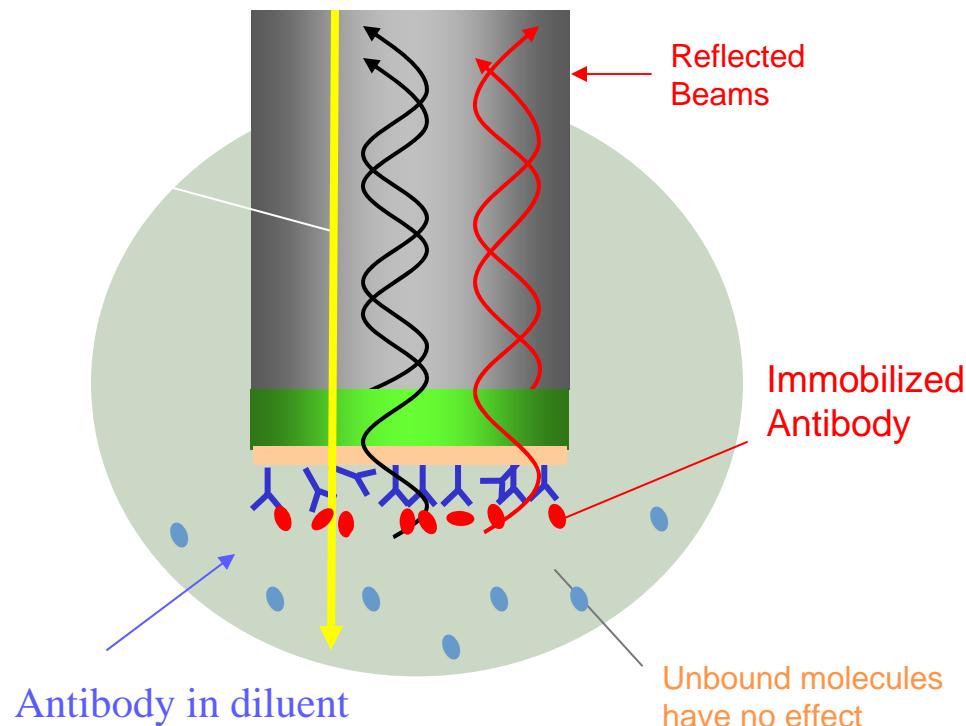

**forté**BIO™

# Bio-Layer Interferometry (BLI), continued

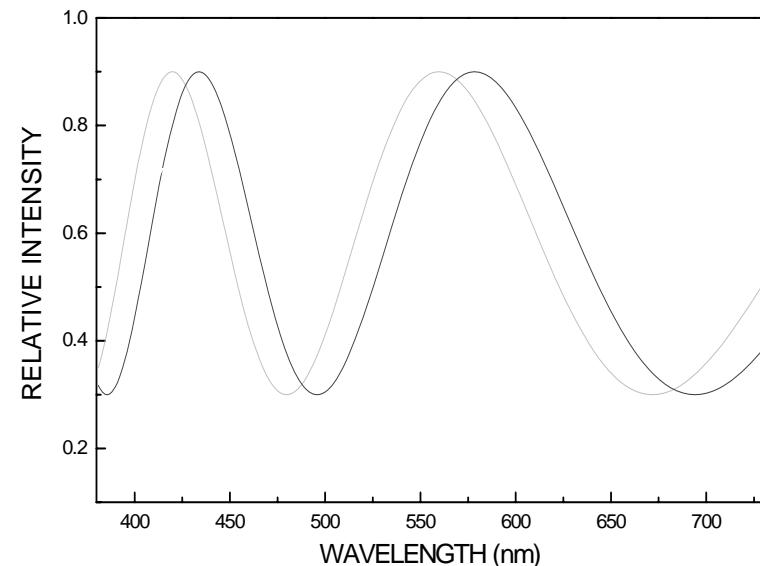

Proprietary new technology for label-free detection

- Any change in the number of molecules bound causes a measured shift in the wavelength pattern

**fortéBIO™**

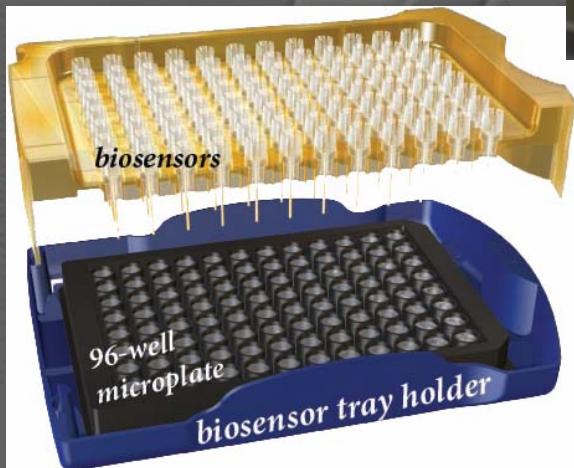

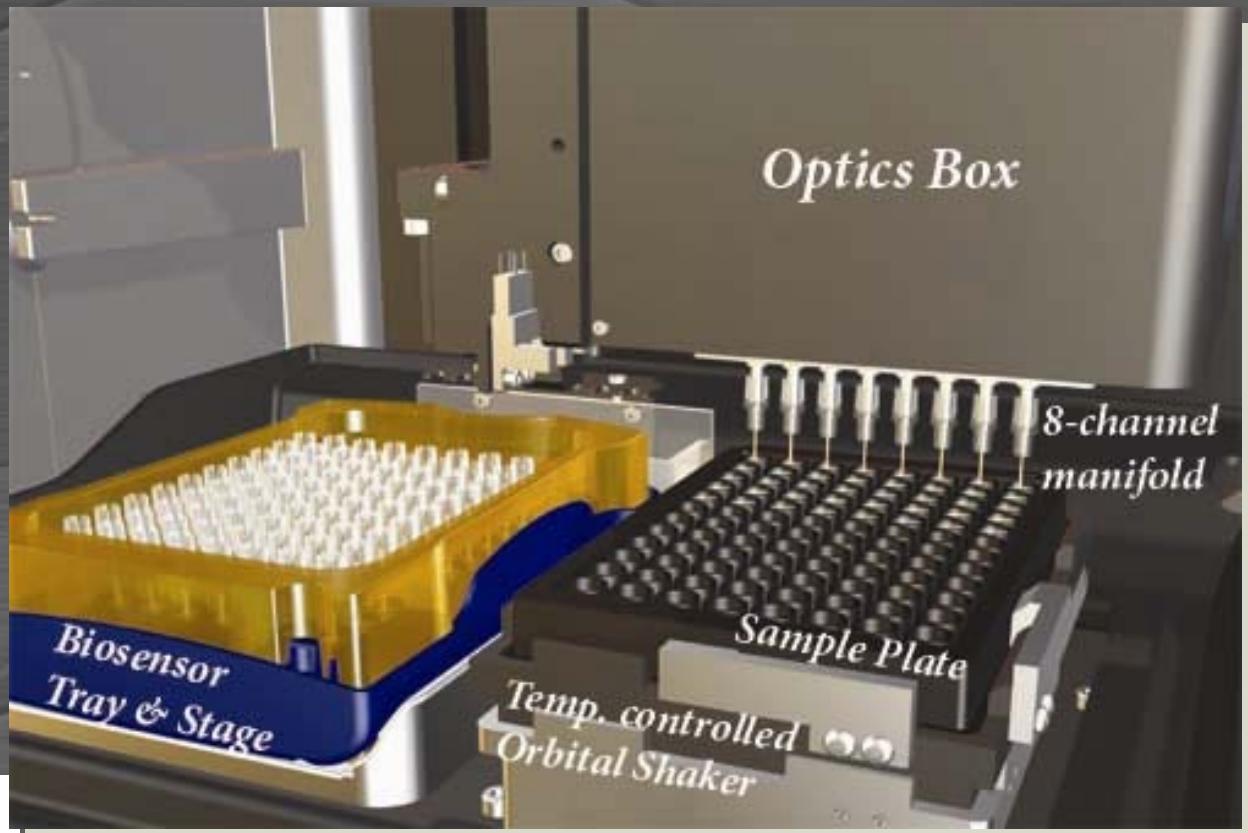

$\Delta\lambda$  = Layer thickness

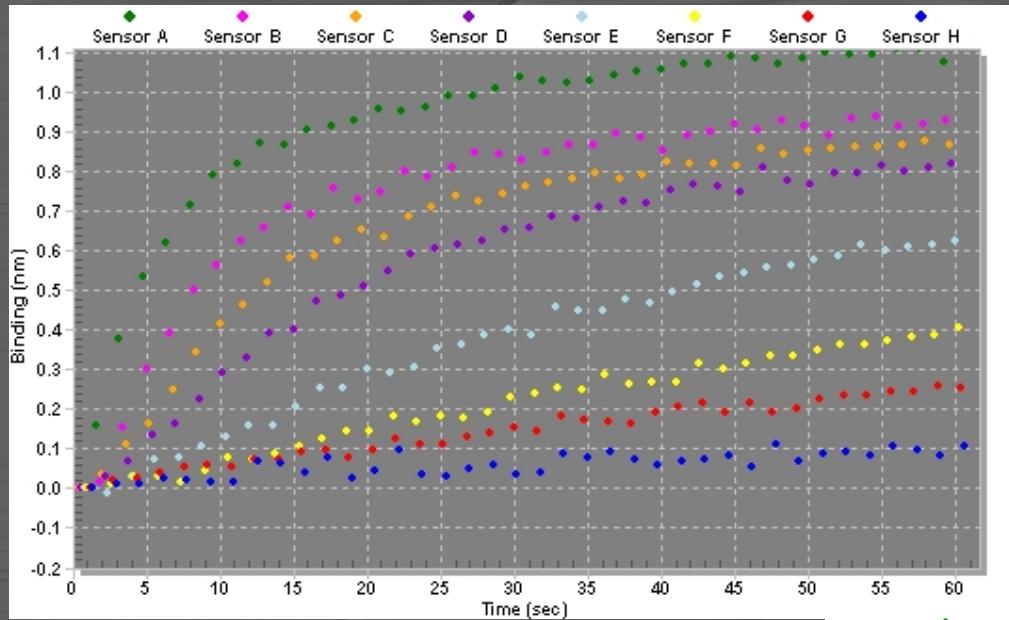

1nm wavelength shift = 0.97nm thickness

**fortéBIO**™

# *Standard Curve*

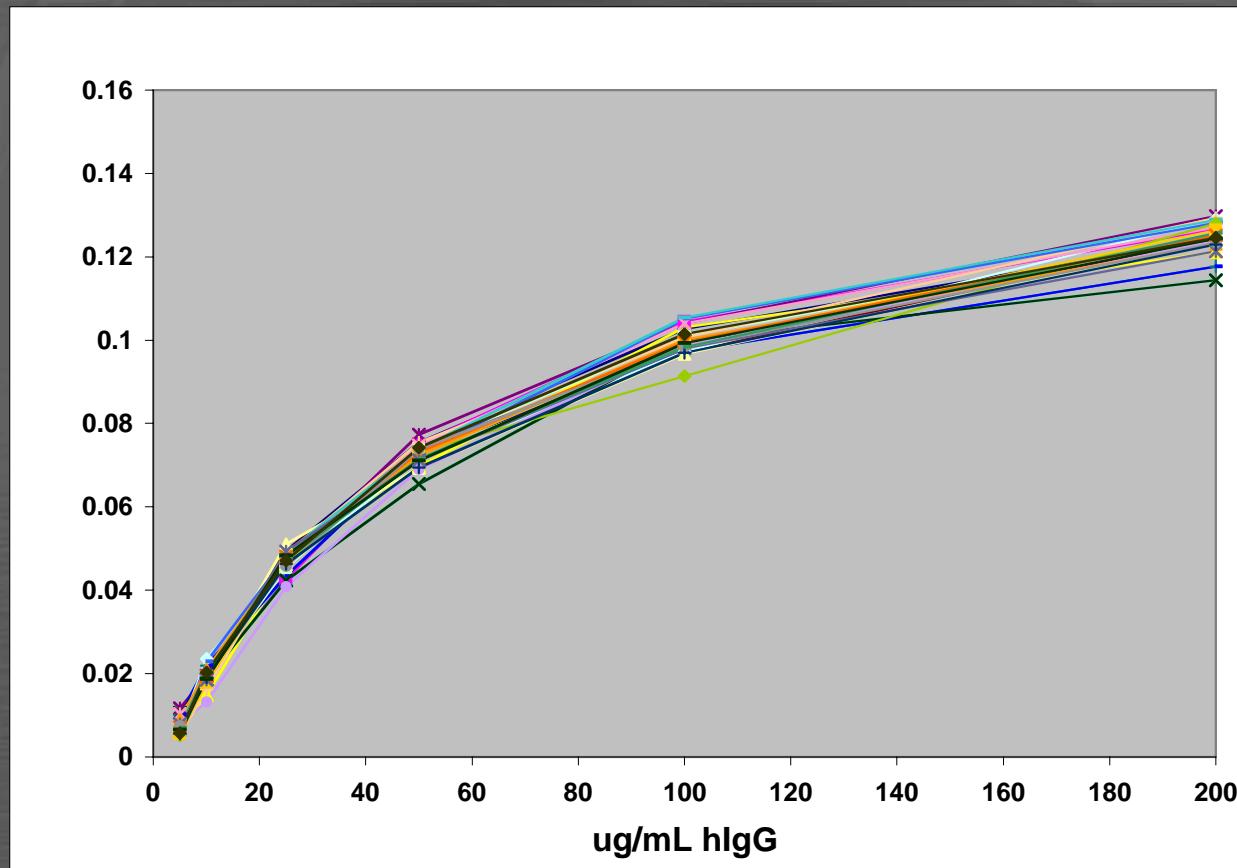

# *Concentrations Based on Binding Rates of Standards*

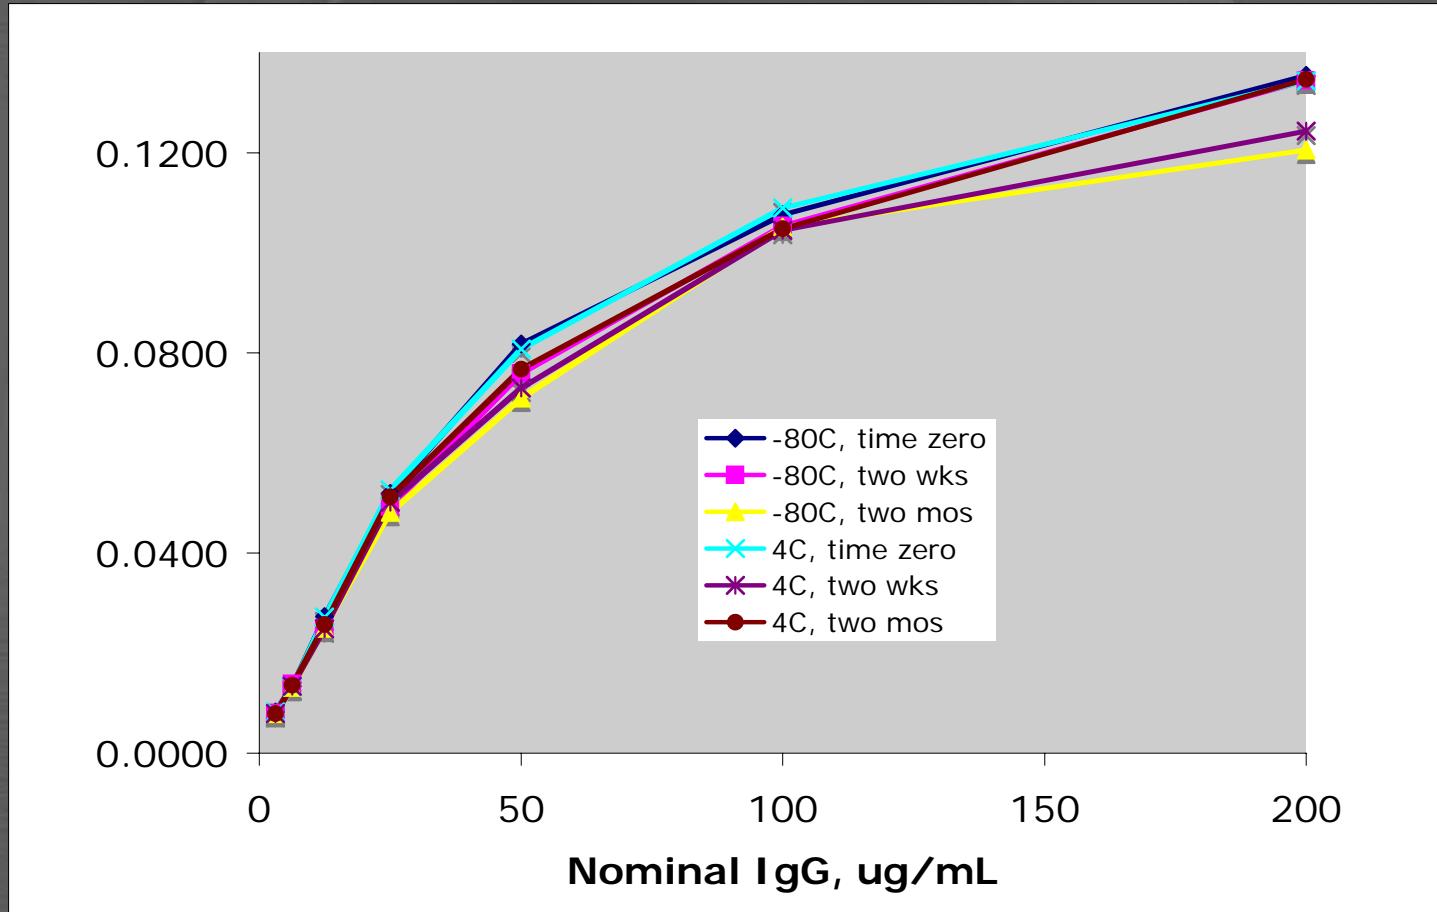

# *ForteBio Polyclonal Standards*

27 runs, 4 users, 12 days

# Raven MAb Standards

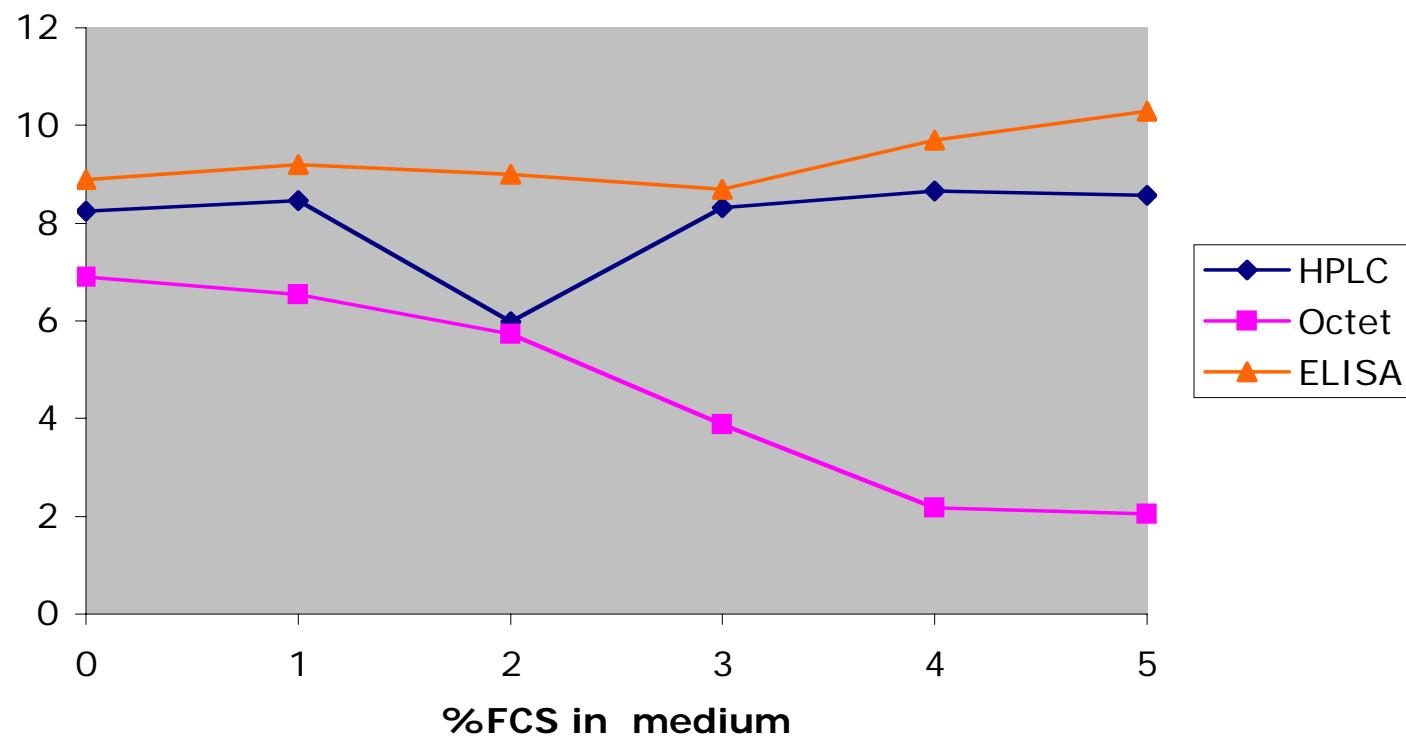

%CV's ranged from 2 - 7% (n=3)

## *Specificity*

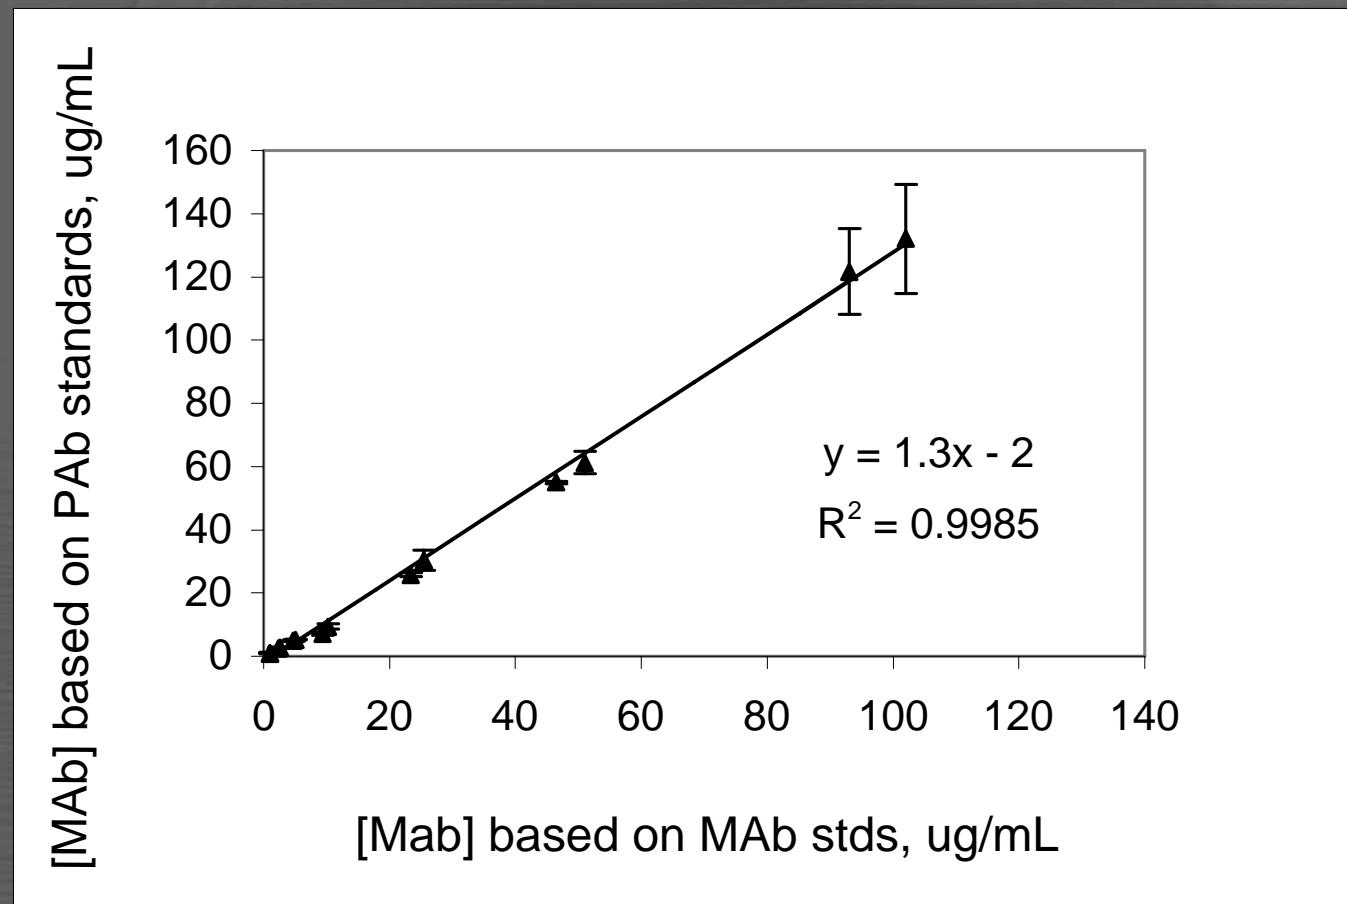

- Fiber optic tips coated with polyclonal anti-hulgG
- No signal from murine IgG1, IgG2a, IgG2b  
(tested up to 100 ug/mL)
- No signal from neat FBS, but serum can suppress binding
- Background problems reduced by prewetting tips in appropriate matrix

## Determination of 10ug/mL MAb in Presence of FCS

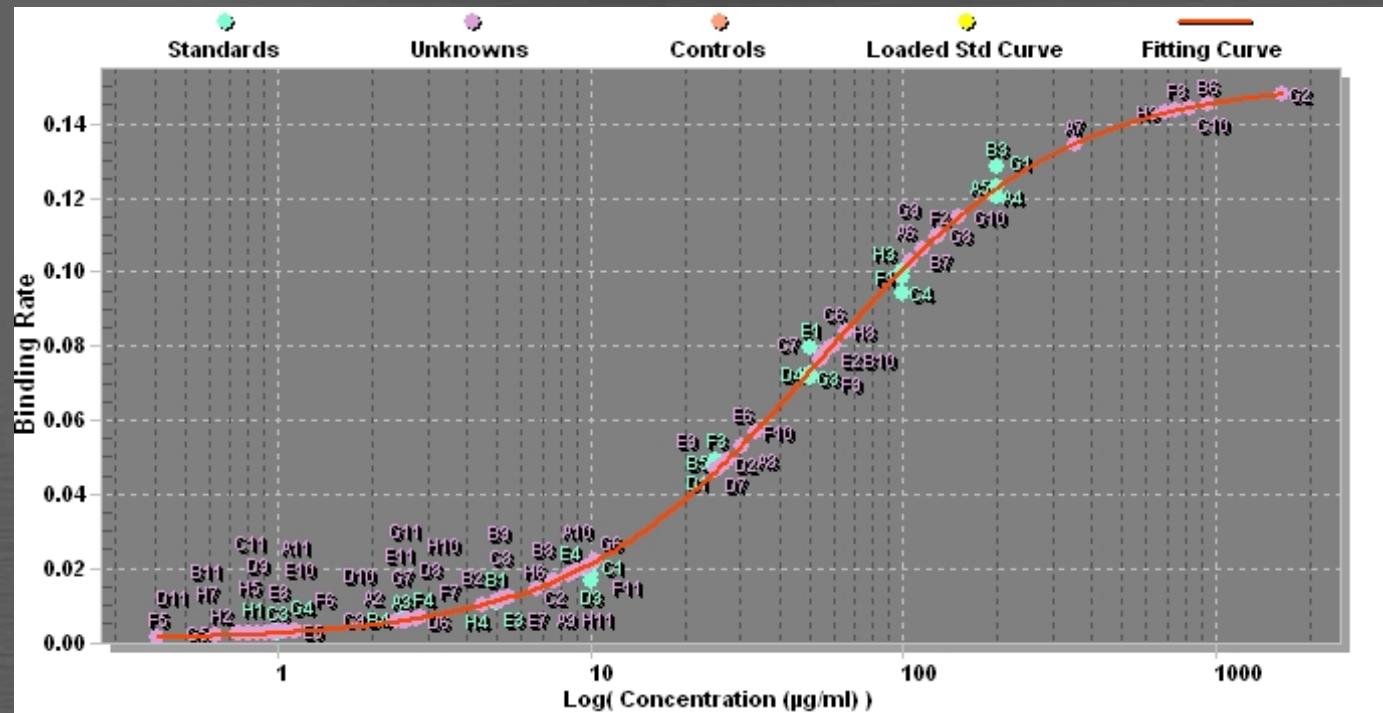

# *Polyclonal vs. Monoclonal Standards*

*Values are consistently 30% higher*

- Raven std is IgG1; ForteBio std is polyclonal, multiple isotypes which may have different binding rates.
- Because of semi-log plot, small difference in binding rate at high end translates into larger difference in apparent concentration.

### Resin Binding Capacity

## *ProA Tips vs. anti-huIgG Tips*

- Wider dynamic maximum range  
(1 - 750 vs. 1 - 200 ug/mL)
- More uniform binding rate than polyclonal
- May reflect recovery on proA resin
- Not restricted to human IgG's  
Mouse, fusion proteins, etc.

# *Alpha Testing - Correlation with proA HPLC*

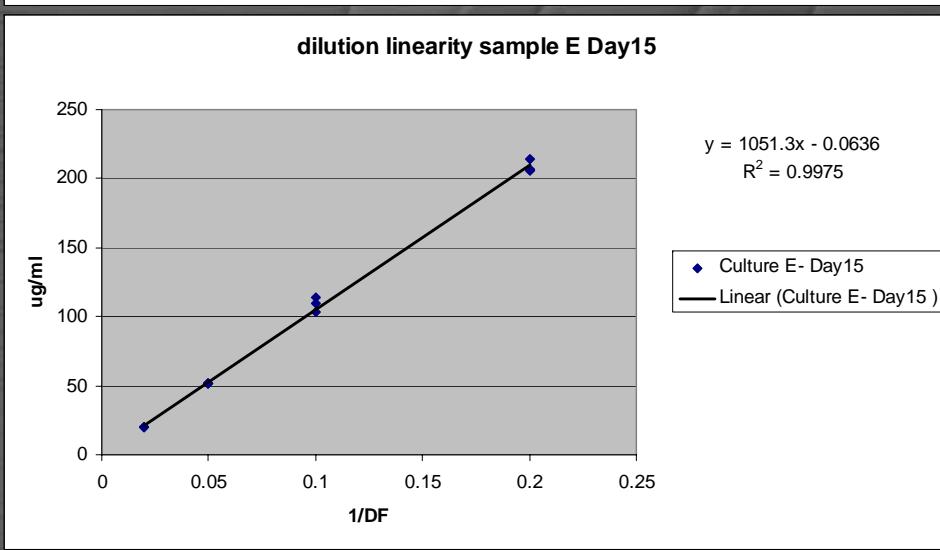

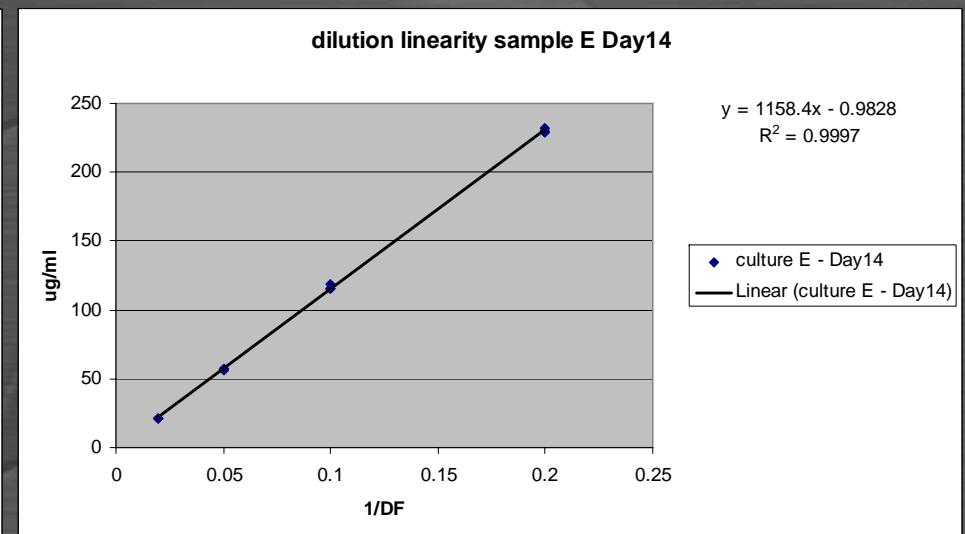

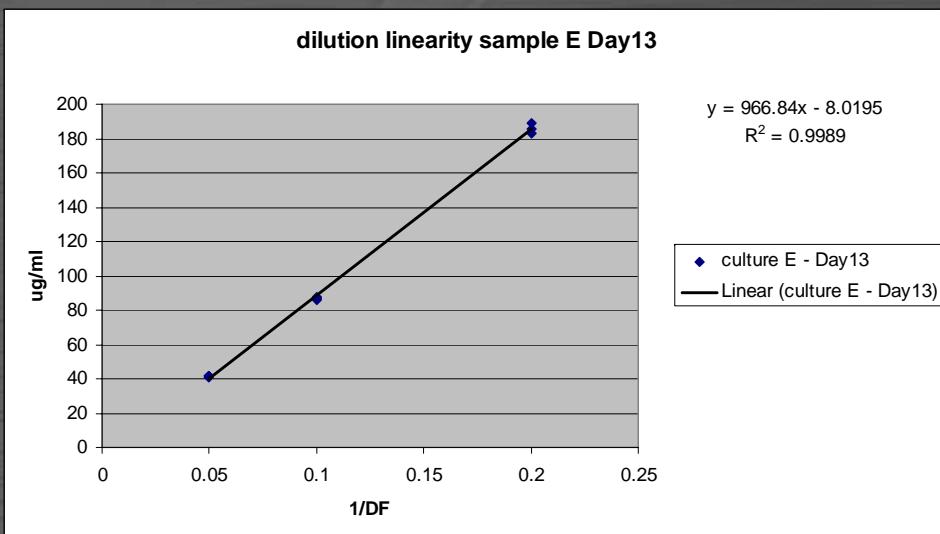

- All samples were assayed neat
- Tips were pre-wet using fresh medium

**forté**BIO™

# Dilution Linearity in Media

Day13 – 1:5, 1:10, 1:20

Day14 & 15 - 1:5, 1:10, 1:20, 1:50

# Bioreactor Titors: Comparison of Quantitative Methods

Raven biotechnologies, inc. Raven biotechnologies, inc. Raven biotechnologies, inc. Raven biotechnologies, inc.

# *Summary*

## *Bio-Layer Interferometry*

- Rapid
- Easy
- Linear
  - 1 - 200 ug/mL with anti-hulgG tips
  - 1- 750 ug/mL with proA tips
- Robust
- Excellent correlation with proA HPLC and ELISA

# *The Best Method? It depends...*

## Octet

- Fast turnaround
- Low skill requirement
- Simple or no dilution required

## ELISA

- High throughput
- Labor intensive (or use robot)
- Very sensitive
- Can distinguish between intact MAbs and fragments

## *At Raven*

- Octet for monitoring upstream and downstream processes
- ELISA for high-throughput clone screening

# *Acknowledgments*
